# Functionality plan

Choosing fortune animation

When the user clicks on a color, the original box content will "slide" up/down and back, "slide" left/right and back by animating the position of those boxes. When the animation stops, the current box hides and the new box fades in. When it goes from color to numbers, the headline also changes after animations to "Choose a number". These animations will be achieved through jQuery animations and by adding and removing classes that will alter CSS of elements. JavaScript is also used for the setTimeout delay functionality.

Reveal fortune animation

When a user clicks on a number the second time to reveal their fortune, the selected number will grow in size and pulse a couple times and then the content of the whole page (everything in the white background) will fade out. Afterwards, the message will fade in (message will be dynamic from a list of ten fortunes). The 'Start over' button will fade in after a slight delay so that the user reads the message first and then sees the button. These animations will be achieved through jQuery animations and by adding and removing classes that will alter CSS of elements. JavaScript is also used for the setTimeout delay functionality.
